## **AMENDMENTS TO THE CLAIMS:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

## **LISTING OF CLAIMS**

- 1. (Currently Amended) A method of constructing an abstract discrete system suitable for formal analysis from a hybrid system with respect to a property of interest, wherein at least one of the property of interest and a guard of a mode change transition of the hybrid system comprise at least one polynomial, said method comprising the steps of:
- a) selecting [[a]] <u>an initial</u> set of polynomials from the polynomials contained in <u>one or both of</u> the property of interest and <u>the guards of the mode change transitions of</u> the hybrid system;
- b) saturating the selected set of polynomials, by repeatedly choosing a polynomial from the selected set of polynomials and adding a time derivative of the chosen polynomial to the set unless the time derivative is a constant or a constant multiple of a polynomial already in the set;
- c) constructing the abstract discrete system over a set of abstract states defined by the positive, negative and zero valuation of the saturated set of polynomials; and
  - d) storing the abstract discrete system.
- 2. (Original) A method as in claim 1 wherein the step of saturating the selected set of polynomials is stopped before normal termination.
- 3. (Original) A method as in claim 1, wherein the hybrid system has no discrete components.
- 4. (Canceled)

- 5. (Currently Amended) A method for determining the validity of a property of interest with respect to a hybrid system, wherein at least one of the property of interest and a guard of a mode change transition of the hybrid system comprise at least one polynomial, said method comprising the steps of:
- a) abstracting the hybrid system to create an abstract discrete system, wherein abstracting comprises constructing an abstract discrete system over a set of abstract states defined by the positive, negative, and zero valuation of a saturated set of polynomials constructed by saturating an initial set of polynomials selected from the polynomials contained in one or both of the property of interest and the guards of the mode change transitions of the hybrid system, wherein saturating comprises repeatedly choosing a polynomial from the selected set of polynomials and adding a time derivative of the chosen polynomial to the set unless the time derivative is a constant or a constant multiple of a polynomial already in the set;
- b) analyzing the validity of the property of interest with respect to the abstract discrete system; and
  - c) outputting the validity of the property of interest.
- 6. (Previously Presented) The method of claim 5, further comprising:
- d) where the property of interest is invalid with respect to the abstract discrete system, creating a finer abstraction of the hybrid system and analyzing the property of interest with respect to the finer abstraction.
- 7. (Original) The method of claim 5, wherein analyzing the validity of the property of interest is performed by model checking.
- 8. (Original) The method of claim 5, wherein the hybrid system is a model of a biological system.
- 9. (Original) The method of claim 5, wherein the hybrid system is a model of a biological organism.
